  - PC Integration Capabilities
- Full Reporting and Web-based Administration

# SECURE PATH NETWORKS

## VOIP ANALYSIS/AUDITING

Voice Over Internet Protocol technology is poised to revolutionize the telecommunications industry in a way not seen since the introduction of the World Wide Web. Secure Path Networks recognizes this change and its importance, and is working with a large number of clients and vendors to help make the transition to the technology. There are a number of questions that need to be answered, however, before you can make the leap into the world of VoIP. SPN helps you answer those questions:

- Is your Local Area Network ready?
- Have you allotted the budget for the necessary hardware purchases, equipment upgrades, bandwidth enhancements, etc?
- Is your data network secured?
- Have you determined what your current local and long-distance usage and requirements are?
- Does your VOIP solution require interoperability with traditional voice lines (POTS)?
- Do you know how much you currently spend for local and long-distance service from your current provider?
- Do you currently have a backup solution for your data network?

### **Comprehensive ROI Analysis**

Before you can begin to realize the benefits of these solutions - you need to understand if it is right for you financially. SPN will perform a full audit of your current usage, spending, and features, and come up with a solution from one of our VOIP partners that fits your needs. From that solution, you will clearly see the monthly savings as well as your return on the investment you will make.

### **Asset Inventory Tracking and Consolidation**

From the results of the comprehensive audit and ROI analysis, should you choose to work with SPN for your VoIP solution, we will centralize the results of the audit, including all of your current voice and data lines into a central application. We give you web-based access to the application that houses this information so you can reference your important asset information when you need it.

### **Bridge the Gap with No Business Interruption**

Considering that most organizations today are using traditional POTS based voice lines for their telephony - there will be a gap to transition to IP Telephony. We perform interviews with your organizations telephony stakeholders to verify that your current expectations are still satisfied with the new solution. It's critical to the success of the transition that your operations are only impacted positively and that all of the benefits of the technology is made available to you.
